

The present mining areas identified on page 4-A are expected to be the total areas involved for the next three years. If sufficient markets can be developed, an additional two acres will be developed adjacent to active area #2 (identified in yellow on map Page 4-A).

A seam of higher quality bentonite has been located in a previously mined pit to the northeast of the second red knoll (area identified in brown on map Page 4-A). If a market for this higher quality bentonite can be developed. This pit will be reopened. The total acreage to be involved at this location is not expected to exceed three acres.

Both of the above mentioned additional areas are very tentative at this writing and are included for the purpose of advising the Division of Oil Gas & Mining of possible future activities only.
